Recent Research Projects

Unsupervised Single-View Mesh Reconstruction, Sep. 18 - Present

- Present a highly effective differentiable renderer that can faithfully approximate the standard rasterization based graphics renderer in the forward pass of deep neural network. Based on this renderer, our unsupervised single-view reconstruction approach has achieved comparable results to the supervised counterparts and in various cases even better ones.

Interactive Facial Hair Editing and Synthesis, Jun. 2017 - Present

- Users can design facial hairs of different shapes/lengths/densities via simple sketching, while keeping the style of a target facial hair defined by an exemplar image. The framework is powered by Generative Adversarial Network (GAN).

Point Cloud Feature Learning using Radial Basis Functions, Mar. 18 - Present

- Present a simple yet effective framework for point set feature learning by leveraging a nonlinear action layer based on Radial Basis Function (RBF) kernels. The proposed approach can explicitly model the spatial distribution of point cloud which leads to a superior performance compared with PointNet++.

Autocomplete Hair Modeling in VR, Jun. 17 - Present

- Develop a 3D VR authoring system for immersive interaction with the hair models. Our system combines the flexibility of manual authoring, the convenience of data-driven automation and the power of machine learning for high quality hair modeling.
