RECENT RESEARCH PROJECTS

Autocomplete Hair Modeling in VR, Jun 17 - Present

- Develop a 3D VR authoring system for immersive interaction with the hair models. Our system combines the flexibility of manual authoring, the convenience of data-driven automation and the power of machine learning for high quality hair modeling.

Interactive Facial Hair Editing and Synthesis, Jun. 2017 - Present

- Users can design facial hairs of different shapes/lengths/densities via simple sketching, while keeping the style of a target facial hair defined by an exemplar image. The framework is powered by Generative Adversarial Network (GAN).

Perspective Undistortion of Unconstrained Portrait Photos, Mar. 18 - Present

- A deep learning based approach to rectify the facial distortion in an unconstrained portrait image shot in a near range. The technique would improve the robustness and accuracy of 3D face reconstruction from a single unconstrained portrait photo.

Point Cloud Feature Learning using Radial Basis Functions, Mar. 18 - Present

- Present a simple yet effective framework for point set feature learning by leveraging a nonlinear action layer based on Radial Basis Function (RBF) kernels. The proposed approach can explicitly model the spatial distribution of point cloud which leads to a superior performance compared with PointNet++.
